

Meeting 7

10/26 - 6:30pm

Attendance: Nova, Zion, Matt, Nathan

We recently had a meeting with Ben where he 'explained' how his codebase worked. It wasn't a very good explanation and we don't think he had much of an idea of how it worked. His codebase used a lot of Javascript handlebars.

Discussed our options for how to continue Caedin and Ben's work. We don't have a great idea of how handlebars work or why he used them.

We decided to email them asking for a brief explanation on their work. Here is the draft of the email:

Hello Caedin & Ben,

I'm emailing on behalf of my capstone team. We've been tasked with handling the studio to stadium website and myself and my group just had some questions about the code.

We need access to the deployed version of the website so we can perform edits.
Does the deployed version of the website need any credentials for us?

We would love some explanations on the functionality of the handlebars. Why did you use handlebars instead of javascript?

We looked up several tutorials on how to use handlebars as well. However, we brought up the possibility of starting from scratch and what that would entail. Given how spotty Caedin and Ben are, it is looking more and more likely.
